

Clinic Performance Analytics Dashboard

Project Overview:

This project analyzes the performance of a healthcare clinic network using Power BI. The dashboard focuses on revenue, patient activity, doctor performance, and procedure efficiency. The goal is to identify key revenue drivers and support data-driven decision-making.

Business Questions:

- Which clinics generate the highest revenue?
- Which doctors are the most and least effective?
- What procedures drive the majority of income?
- How does revenue change over time?
- What patient segments contribute most to revenue?
- Where are there opportunities for growth?

Data Description:

The dataset includes information about:

- Patients
- Doctors
- Clinics
- Visits
- Procedures and pricing

Tools & Skills:

- Power BI
- Data Modeling (Star Schema)
- DAX Calculations
- Data Visualization

PS: This project is built upon a custom-designed database developed by the author. The data architecture and table structures were engineered to demonstrate relational logic and analytical capabilities within Power BI. All insights and visualizations are derived specifically from this proprietary dataset.

Key Insights & Recommendations

Key Insights:

- Grand total is highly concentrated in a small number of doctors, with top performers generating a significant share of total income
- One clinic (Ichilov - Tel Aviv) dominates revenue contribution, indicating strong performance but also potential dependency risk
- Certain procedures (e.g., Herniated Disc treatment) generate the majority of revenue, while others contribute minimally
- Patient volume is relatively low (40 patients), but average check is high, indicating a high-value service model
- Age distribution shows concentration in mid-age groups, suggesting a specific target audience segment

Business Interpretation:

- The business relies heavily on a few key doctors and procedures, which increases operational risk
- High average check suggests premium pricing or specialized services
- Clinics with high visit volume do not always generate proportional revenue, indicating efficiency differences
- The patient base is relatively small but generates strong revenue, pointing to a quality-over-quantity model

Recommendations:

- Reduce dependency on top-performing doctors by improving performance across the team
- Focus marketing and operational efforts on high-revenue procedures
- Review pricing and discount strategy for lower-performing procedures
- Analyze clinic efficiency to align workload with revenue generation
- Expand patient acquisition while maintaining high average revenue per patient
